

The linear feet of a tent's perimeter is the sum of the 4 sides of the tent. In this example - based on a 30' x 60' tent - there is 180 feet around it's perimeter

$$(30' + 60' + 30' + 60' = 180')$$

Sidewalls can be used for all or part of the tent's perimeter - 1, 2, 3, or all 4 sides - even partially along a side.
